
Introduction to Machine Learning and Python Programming

— Ali Madani —
Farnoosh Khodakarami

What is Machine Learning?

**We want computers act like human
(AI paradigm)**

**Human learn from past experiences
Computers Follow instructions**

Field of study that gives computers the ability to learn without being explicitly programmed

(Arthur Samuel 1951)

<https://www.ibm.com/ibm/history/ibm100/us/en/icons/ibm700series/impacts/>

The Samuel Checkers-playing Program was among the world's first successful self-learning programs.

He coined the term "machine learning" in 1959

We are lucky

Because of the following reasons, learning how to implement ML and use it in industrial setting became much easier

- Programming became easier
- Computational power
- Data availability

Computational power and Moore's law

Moore's Law – The number of transistors on integrated circuit chips (1971-2018)

Moore's law describes the empirical regularity that the number of transistors on integrated circuits doubles approximately every two years. This advancement is important as other aspects of technological progress – such as processing speed or the price of electronic products – are linked to Moore's law.

Data source: Wikipedia (https://en.wikipedia.org/wiki/Transistor_count)
The data visualization is available at [OurWorldinData.org](https://www.ourworldindata.org). There you find more visualizations and research on this topic.

We have huge responsibility

- Do not overpromise
 - It is not magic if
 - we are not magicians
 - the proper ingredient (data) is not available
 - the goal is properly defined

We have huge responsibility

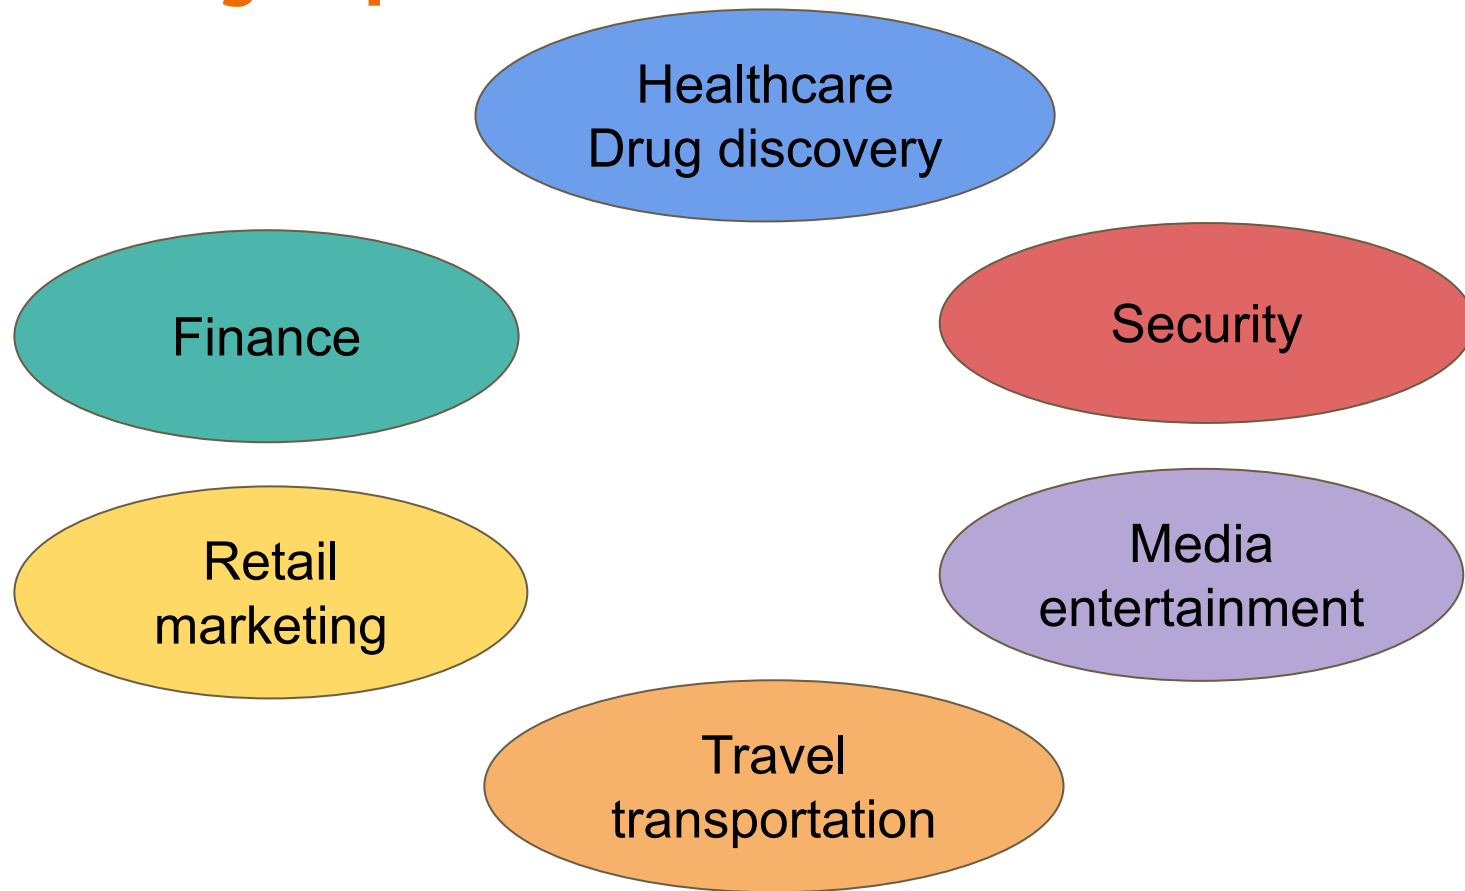

- Do not overpromise
 - It is not magic if
 - we are not magicians
 - the proper ingredient (data) is not available
 - the goal is properly defined
- Proper implementation of ML models
- Proper interpretation

Machine learning application

Four industrial revolutions

ML had big impact in some of the industries

Example of ML in healthcare and drug discovery

CYCLICA

Genentech

NOVARTIS

GlaxoSmithKline

Example of ML in finance

Example of ML in retail and marketing

Example of ML in media and entertainment

Social media

Example of ML in media and entertainment

Example of ML in transportation

The Uber logo, consisting of the word "Uber" in a bold, black, sans-serif font.The FedEx logo, featuring the word "FedEx" in a bold, sans-serif font. The "Fed" is in blue and the "Ex" is in orange, with a registered trademark symbol (®) to the right.

Machine learning Project steps:

1. Problem Definition.
2. Data Preparation.

Gathering Data

Cleaning Data

3. Model Building
4. Algorithms Evaluation.
5. Results Improvement.
6. Results Presentation.

322 SOUTHERN LIFE IN SOUTHERN LITERATURE

restless enthusiasm catch from one bystander to another. They swing and how to right and left, in slow time to the jarring creak of the Congo women. Some are responsive; others are competitive. Hear that bare foot slap the ground! one sudden snort only, as it were the foot of a stag. The musicians warm up at the sound. A smiting of breasts with open hands begins very softly and becomes vigorous. The women's voices rise to a tremendous intensity. Among the choros of France-Congo singing-girls is one of extra good voice, who thrums in, now and again, an improvisation. This girl here, so tall and straight, is a Yaloff. You see it in her almost Hindu features, and hear it in the plaintive melody of her voice. Now the chorus is more plaintive than ever. The women clap their hands in time or standing with arms skimping together with faint convulsions and feet following the low bow of the feet, who deliver their awaying the way and then.

See! Yonder bristly and stoney fellow has taken one short, surry step into the ring, chanting with rising energy. Now he takes another, and stands and sings and looks here and there, clapping his head now and clinking and clinking again, with what wonderful lightness! How tall and liss he is. Notice his knees, sliding through his legs. He too is a stoney, and by the three long rays of tattooing on each side of his face, a Kikanda. The music has got into his feet. He moves off to the farther edge of the circle, still singing, takes the prompt hand of an unwilling Congo girl, leads her into the ring, and, leaving the chant to the throng, stands her before him for the dance.

Will they dance to that measure? Well! A sudden frenzy seizes the musicians. The measure quickens, the awaying, antiphonal crowd starts into extra activity, the female voices grow sharp and staccato, and suddenly the dance is the furious Bantulu.

Data Records
(samples)

Size	Location	...	#Rooms	Output

A **data set** (or **dataset**) is a collection of data
Every column of the table represents a particular variable,
Each row corresponds to a given member of the **data set**

Machine learning in practice

Introduction to Python programming

Why Python?

open sourced

easy to use

multi-paradigm

**Extensive Support
Libraries**

Python vs R?

Environment: IDLE, Shell

- IDLE ,**Integrated DeveLopment Environment**, is the standard Python development environment.
- It works well on both Unix and Windows platforms.
- It has a Python shell window, which gives you access to the Python **interactive mode**.
- It also has a file editor that lets you create and edit existing Python source files.

Environment: Jupyter Notebook

An open-source web application that allows you to create and share documents that contain:

- ❑ live code
- ❑ Equations
- ❑ visualizations
- ❑ narrative text.

Algebraic operations

- Rank, determinant, trace, etc. of an array.
- Eigen values of matrices
- Matrix and vector products (dot, inner, outer, etc. product), matrix exponentiation
- Solve linear or tensor equations and much more!

Working with numbers, tuples and strings

There are three **numeric** types in Python:
Int, float, complex

String literals in python are surrounded by either single quotation marks, or double quotation marks.

(link to the example)

Set, lists, dictionaries in Python

- **List:** ordered and changeable. Allows duplicate members.
- **Tuple:** ordered and unchangeable. Allows duplicate members.
- **Set:** unordered and unindexed. No duplicate members.
- **Dictionary:** unordered, changeable and indexed. No duplicate members.

Conditioning in Python

Python uses boolean variables to evaluate conditions.

The boolean values True and False are returned when an expression is compared or evaluated.

Loops in Python

Python provides three ways for executing the loops.

While all the ways provide similar basic functionality, they differ in their syntax and condition checking time.

```
for val in sequence:  
    Body of for
```

```
while test_expression:  
    Body of while
```

Writing function in Python

Function is a group of related statements that perform a specific task.

Functions help break our program into smaller and modular chunks. As our program grows larger and larger, functions make it more organized, manageable and readable.

Function avoids repetition and makes code reusable.

```
def function_name(parameters):  
    """docstring"""  
    statement(s)
```

Fundamental packages in Python: numpy

core library for scientific computing

High-performance multidimensional array object

Operations related to linear algebra.

Fundamental packages in Python: matplotlib

- python library used to create 2D graphs and plots by using python scripts.
- pyplot makes things easy for plotting by providing feature to control line styles, font properties, formatting axes etc.
- It supports a very wide variety of graphs and plots namely

Plotting in Python

bars with legend

stacked bar

stack step (unfilled)

different sample sizes

Categorical Plotting

Fundamental packages in Python: pandas

pandas is an open source, BSD-licensed library providing high-performance, easy-to-use data structures and data analysis tools for the Python programming language.

Machine learning in Python using sklearn

scikit-learn

Machine Learning in Python

- Simple and efficient tools for data mining and data analysis
- Accessible to everybody, and reusable in various contexts
- Built on NumPy, SciPy, and matplotlib
- Open source, commercially usable - BSD license

Classification

Identifying to which category an object belongs to.

Applications: Spam detection, Image recognition.

Algorithms: SVM, nearest neighbors, random forest, ...

— Examples

Regression

Predicting a continuous-valued attribute associated with an object.

Applications: Drug response, Stock prices.

Algorithms: SVR, ridge regression, Lasso, ...

— Examples

Clustering

Automatic grouping of similar objects into sets.

Applications: Customer segmentation, Grouping experiment outcomes

Algorithms: k-Means, spectral clustering, mean-shift, ...

— Examples

Dimensionality reduction

Reducing the number of random variables to consider.

Applications: Visualization, Increased efficiency

Algorithms: PCA, feature selection, non-negative matrix factorization.

— Examples

Model selection

Comparing, validating and choosing parameters and models.

Goal: Improved accuracy via parameter tuning

Modules: grid search, cross validation, metrics.

— Examples

Preprocessing

Feature extraction and normalization.

Application: Transforming input data such as text for use with machine learning algorithms.

Modules: preprocessing, feature extraction.

— Examples
